CSS POSITION

Understanding Element Positioning in CSS

Presented by Faryal Razzaq

What is CSS Position?

CSS position tells us **where an element should be placed** on a webpage.
CSS Position helps us control elements.

There are 5 common types:

- Static
- Relative
- Absolute
- Fixed
- Sticky

Top, Right, Bottom, Left → position adjust karte hain

top → upar se move karta hai

right → right side se move karta hai

bottom → neeche se move karta hai

left → left side se move karta hai

1 . Static

Static = Normal Position

position : static ;

- This is the **default position**.
- The element stays in its normal place.
- We normally don't use top, left, right, or bottom.

Example:

A normal heading or paragraph.

2 . Relative

position : relative ;

- The element stays in its original place.
- We can move it a little using top , left, right, or bottom.

Relative
Move a Little

Example:

Move a box 20px to the right.

3 . Absolute

Absolute = Exact Position

position : absolute ;

- The element can be placed exactly where we want.
- It is usually positioned according to its parent.

Example:
A small badge on a card.

4 . Fixed

Fixed = Stays on Screen

position : fixed ;

- The element stays in the same place on the screen.
- It does not move when we scroll.

Example:

Chat button or Whats App button.

5 . Sticky

Sticky = Scroll and Stick

position : sticky ;

- The element starts in its normal place.
- When we scroll, it**sticks**to the screen.

Example:
Navigation bar.

Position Lifecycle

Normal Position

by default.

Move a Little

Apni normal jagah se move ho sakta hai.

Exact Position

Nearest positioned parent ke according place hota hai.

Stays on Screen

Screen par ek jagah fixed rehta hai, scroll karne par bhi.

Scroll and Stick

Scroll karte waqt ek point par stick ho jata hai.

Thank You
